## **1.0 Introduction**

Medical coding systems are fundamental to Medical record keeping as well as for gathering and communicating public health statistics.

### **1.1. Objective**

Medical coding system serves an important function of assigning uniform codes to inputs across all medical data formats for standardisation and for collection of general medical statistical data.

### **1.2. Summary of Medical Inputs coding system**

Medical coding system in this version assigns a distinct alpha-numeric code to the following inputs.

- ◆ **Drugs:** Drugs are coded based on ATC Drug code (WHO Collaborating Centre for Drug Statistics Methodology), Route, Dosage form and Strength of the Drug.
- ◆ **Hospital stay:** Hospital Stays are coded according to the visits and duration of stay in minutes, hours and days.
- ◆ **Lab Investigations & Imageology:** Lab Investigations & Imageology are coded according to Groups and tests under each group.
- ◆ **Consumables:** Consumables are coded either under specialities or general category based on their usage.
- ◆ **Disposables:** Disposables are coded either under specialities or general category based on their usage.
- ◆ **Implants:** Implants are coded either under specialities or general category based on their usage.

## 2.0 Drug Coding

### 2.1 General

This section of coding system covers the coding of Drugs currently used under Aarogyasri packages.

### 2.2 Drug Code Format

The Drug code format is:

<u>ANNAANN</u>	<u>AA</u>	<u>ANNN</u>
ATC Drug code	Route & Dosage form code	Strength code

**2.2.1.** The **ATC Drug code** is 7 characters alpha-numeric and code format is **ANNAANN**

The Anatomical Therapeutic Chemical (ATC) Classification System is used for the classification of drugs. It is controlled by the WHO Collaborating Centre for Drug Statistics Methodology (WHOCC), and was first published in 1976.

In the ATC classification system drugs are classified in groups at five different levels.

- 1st level: Anatomical main group
- 2nd level: Therapeutic subgroup
- 3rd level: Pharmacological subgroup
- 4th level: Chemical subgroup
- 5th level: Chemical substance

**Example:** The complete classification of drug Metformin illustrates the structure of the ATC classification system:

- 1<sup>st</sup> level Anatomical main group: **A** Alimentary tract and metabolism
- 2<sup>nd</sup> level Therapeutic subgroup: **A10** Drugs used in diabetes
- 3<sup>rd</sup> level Pharmacological subgroup: **A10B** Blood glucose lowering drugs, excl. Insulin's

4<sup>th</sup> level Chemical subgroup: **A10BA** Biguanides

5<sup>th</sup> level Chemical substance: **A10BA02** Metformin

Thus, in the ATC system all plain metformin preparations are given the code **A10BA02**.

The 1st, 2nd, 3rd and 4th levels are often used to identify pharmacological subgroups when that is considered more appropriate than therapeutic or chemical subgroups.

The currently used list of Drugs with ATC codes are given in **Annexure 1**.

**2.2.2.** The **Route & Dosage form code** is of 2 alphabetical characters and code format is **AA**.

It indicates route of administration and dosage form of the drug.

The route and dosage form codes are given in **Annexure 2**.

**2.2.3.** The **Strength code** is 4 alpha-numeric characters and code format is **ANNN**.

It indicates unit and strength of the drug.

The strength codes are given in **Annexure 3**.

**2.2.4.** The currently used list of Drugs with drug code are given in **Annexure 4**.

### **3.0 Input coding for Hospital Stay, Lab Investigations, Consumables, Disposables and Implants**

#### **3.1 General**

The coding system covers the clinical inputs which go into the therapies of the patients under five broad categories of Hospital Stay, Lab investigations, Consumables, Disposables and Implants.

#### **3.2 Input code format**

The input code format is: A NN.NNN

◆ **1<sup>st</sup> Level-A:** Class code is denoted by alphabetical character (A) and is the first letter of the code. Class codes for Hospital Stay, Lab investigations, Consumables, Disposables and Implants are given in **Annexure 5**.

◆ **2<sup>nd</sup> Level-NN:** The second and third characters indicate the category code and is denoted by two digit numerical code (NN). Intelligence is built

into them by reserving certain codes to sub-groups. Individual category codes for Hospital Stay, Lab investigations, Consumables, Disposables and Implants are given in **Annexure 5**.

◆ **3<sup>rd</sup> Level-NNN**: Last three digits indicate the item code and is denoted by three digit numerical code (NNN) representing the sequence number of the item enlisted. Item codes for Hospital Stay, Lab investigations, Consumables, Disposables and Implants are given in **Annexure 6**.

Example: In the code I02.004, (I) indicates lab investigation, (02) indicates category viz., serum in the biochemistry, and (004) indicates 'serum electrolytes levels'.

### **3.2.1 Hospital Stay**

This section of coding system covers the coding of hospital stays of patient in different service centers of the hospital. The currently used list of hospital stays in Aarogyasri packages with class code & category codes are given in **Annexure 5** and the item codes are given in **Annexure 6**.

### **3.2.2. Lab investigations & Imageology**

This section of coding system covers the coding for lab investigations in four categories department wise viz., biochemistry, microbiology, pathology, and imageology. Those investigations, which are performed by the specialists, such as TMT, ENMG and endoscopy procedures are classified under 5<sup>th</sup> category viz., speciality. The currently used list of lab investigations & imageology in Aarogyasri packages class code & category codes are given in **Annexure 5** and the item codes are given in **Annexure 6**.

class code & category codes are given in **Annexure 5**, and the item codes are given in **Annexure 6**.

### **3.2.5. Implants**
